

POS908 Installation Instructions

PC application software version 1.3.1.0

Summary:

This document describes the end-user installation steps required to get the POS908 to function properly.

Background

The new POS908 uses a serial port emulator over USB to allow vendor-specific applications to send a string sequence over (simulated) RS232, thus allowing for behavior similar to the POS808.

Application Installation

Run the pos908setupV1_31 file on the CDROM. This should install the following files to the C:\Program Files\POS908 folder:

- 1) POS908.exe
- 2) Usbser.sys
- 3) Usbprint.sys
- 4) POS908_usbprint.inf
- 5) POS908_usbser.inf

Other support files (MFC DLLs) are installed into the C:\Windows\System32 folder.

Application Uninstallation

In Add/Remove Programs in Control Panel, select "POS908 Installer" and select "Remove" from the dialog that appears.

Driver Installation

The user will need Admin rights to install the driver.

Once the application installation has finished, open Windows Explorer and navigate to C:\Program Files\POS908.

To install the serial port emulator over USB:

Right-click the file POS908_usbser.inf and select "Install".

The driver installation may take some time to complete.

To install the printer port emulator over USB:

Right-click the file POS908_usbprint.inf and select "Install".

The driver installation may take some time to complete.
